

# Package: glydraw (via r-universe)

May 26, 2026

**Title** Draw beautiful SNFG cartoons

**Version** 0.4.1

**Description** Draw beautiful SNFG cartoons.

**License** MIT + file LICENSE

**Suggests** testthat (>= 3.0.0)

**Config/testthat/edition** 3

**Encoding** UTF-8

**Roxygen** list(markdown = TRUE)

**RoxygenNote** 7.3.3

**URL** <https://glycoverse.github.io/glydraw/>

**Imports** glyrepr (>= 0.10.0), rlang, dplyr, ggplot2, igraph, purrr,  
glyparse, cli, ggview, checkmate, scales, fs, glyexp

**Config/pak/sysreqs** cmake libglpk-dev make libicu-dev libuv1-dev libxml2-dev

**Repository** <https://glycoverse.r-universe.dev>

**Date/Publication** 2026-05-26 09:52:07 UTC

**RemoteUrl** <https://github.com/glycoverse/glydraw>

**RemoteRef** v0.4.1

**RemoteSha** 64be6ac014d255c86af1b7bda2d65db772141861

`draw_cartoon`*Draw a Symbol Nomenclature For Glycan (SNFG)*

---

## Description

Draw a Symbol Nomenclature For Glycan (SNFG)

## Usage

```
draw_cartoon(  
  structure,  
  show_linkage = TRUE,  
  orient = c("H", "V"),  
  highlight = NULL  
)
```

## Arguments

<code>structure</code>	A <code>glyrepr::glycan_structure()</code> scalar, or a string of any glycan structure text nomenclatures supported by <code>glyparse::auto_parse()</code> .
<code>show_linkage</code>	Show linkage annotation or not. Default is TRUE.
<code>orient</code>	The orientation of glycan structure. "H" for horizontal, "V" for vertical. Default is "H"
<code>highlight</code>	An integer vector specifying the node indices to highlight. This argument is applicable only when <code>structure</code> is a <code>glyrepr::glycan_structure()</code> . Note that for a <code>glyrepr::glycan_structure()</code> , the node indices correspond exactly to the monosaccharides in its printed IUPAC nomenclature. For example, given <code>glyrepr::as_glycan_structure("Gal(b1-3)[GlcNAc(b1-6)]GalNAc(a1-")</code> , setting <code>highlight = c(1, 3)</code> will highlight the "Gal" and "GalNAc" nodes.

## Value

a `ggplot2` object

## Examples

```
## Not run:  
draw_cartoon("Gal(b1-3)GalNAc(a1-")  
  
## End(Not run)
```

---

`export_cartoons`*Export all glycan structures to figures*

---

## Description

This function calls `draw_cartoon()` on each glycan structure in `x`, then calls `save_cartoon()` to save a figure for each of them. IUPAC-condensed nomenclatures are used as file names. If `x` is a named character vector or named `glyrepr::glycan_structure()` vector, the vector names are used as file names.

## Usage

```
export_cartoons(  
  x,  
  dirname,  
  file_ext = "png",  
  dpi = 300,  
  show_linkage = TRUE,  
  orient = c("H", "V")  
)
```

## Arguments

<code>x</code>	A <code>glyexp::experiment()</code> , a <code>glyrepr::glycan_structure()</code> vector, or a character vector of any glycan structure text nomenclatures supported by <code>glyparse::auto_parse()</code> .
<code>dirname</code>	Directory name to save the cartoons. If it does not exist, it is created.
<code>file_ext</code>	File extension supported by <code>ggplot2::ggsave()</code> . Defaults to "png".
<code>dpi</code>	Dots per inch. Defaults to 300.
<code>show_linkage</code>	Show linkage annotation or not. Default is TRUE.
<code>orient</code>	The orientation of glycan structure. "H" for horizontal, "V" for vertical. Default is "H"

## Value

The function returns the list of cartoons implicitly.

## Examples

```
## Not run:  
library(glyexp)  
export_cartoons(real_experiment, "path/to/save")  
  
## End(Not run)
```

---

`save_cartoon`*Save fixed-size glycan cartoon image to local device.*

---

### Description

In theory, you can just use `ggplot2::ggsave()` to save the cartoons plotted by `draw_cartoon()`. However, you can have trouble finding the best sizes for each cartoon to make them look alike. This function is designed to save the cartoons with self-adjusted sizes, based on the size of the glycans, so that when glycans with different sizes are put together, they will look alike.

### Usage

```
save_cartoon(cartoon, file, dpi = 300)
```

### Arguments

<code>cartoon</code>	A <code>ggplot2</code> object returned by <code>draw_cartoon()</code> .
<code>file</code>	File name of glycan cartoon.
<code>dpi</code>	Dots per inch, default = 300.

### Examples

```
## Not run:  
cartoon <- draw_cartoon("Gal(b1-3)GalNAc(a1-")  
save_cartoon(cartoon, "p1.png", dpi = 300)  
  
## End(Not run)
```
